

# The Blindingly Simple Protocol Language

Amit K. Chopra

Lancaster University

# Information Protocols (Singh, 2011)

An information-based protocol language

- ▶ Declarative
  - ▶ Bag of protocols (message specification is atomic protocol)
- ▶ Specifies a decentralized information object
- ▶ Specifies information causality
  - ▶ The messages an agent can send depends upon what it knows
  - ▶ Local state approach
- ▶ Asynchronous communication
- ▶ Requires no ordering guarantees from infrastructure

# Traditional Specifications: Procedural

Low-level, over-specified protocols, easily wrong

- ▶ Traditional approaches
  - ▶ Emphasize arbitrary ordering and occurrence constraints
  - ▶ Then work hard to deal with those constraints
- ▶ Our philosophy: The Zen of Distributed Computing
  - ▶ Necessary ordering constraints fall out from *causality*
  - ▶ Necessary occurrence constraints fall out from *integrity*
  - ▶ Unnecessary constraints: simply *ignore* such

# Properties of Participants

- ▶ Autonomy
- ▶ Myopia
  - ▶ All choices must be local
  - ▶ Correctness must not rely on future interactions
- ▶ Heterogeneity: local  $\neq$  internal
  - ▶ Local state (projection of global state, which is stored nowhere)
    - ▶ Public or observable
    - ▶ Typically, must be revealed for correctness
  - ▶ Internal state
    - ▶ Private
    - ▶ Must never be revealed: to avoid false coupling
- ▶ Shared nothing representation of local state
  - ▶ Enact via messaging

# BSPL, the Blindingly Simple Protocol Language

## Main ideas

- ▶ Only *two* syntactic notions
  - ▶ Declare a message schema: as an atomic protocol
  - ▶ Declare a composite protocol: as a bag of references to protocols
- ▶ Parameters are central
  - ▶ Provide a basis for expressing meaning in terms of bindings in protocol instances
  - ▶ Yield unambiguous specification of compositions through public parameters
  - ▶ Capture progression of a role's knowledge
  - ▶ Capture the completeness of a protocol enactment
  - ▶ Capture uniqueness of enactments through keys

# Key Parameters in BSPL

Marked as 「key」

- ▶ All the key parameters *together* form the key
- ▶ Each protocol must define at least one key parameter
- ▶ Each message or protocol reference must have at least one key parameter in common with the protocol in whose declaration it occurs
- ▶ The key of a protocol provides a basis for the uniqueness of its enactments

# Parameter Adornments in BSPL

Capture the essential causal structure of a protocol (for simplicity, assume all parameters are strings)

- ▶  $\ulcorner \text{in} \urcorner$ : Information that must be provided to instantiate a protocol
  - ▶ Bindings must exist locally in order to proceed
  - ▶ Bindings must be produced through some other protocol
- ▶  $\ulcorner \text{out} \urcorner$ : Information that is generated by the protocol instances
  - ▶ Bindings can be fed into other protocols through their  $\ulcorner \text{in} \urcorner$  parameters, thereby accomplishing composition
  - ▶ A standalone protocol must adorn all its public parameters  $\ulcorner \text{out} \urcorner$
- ▶  $\ulcorner \text{nil} \urcorner$ : Information that is absent from the protocol instance
  - ▶ Bindings must not exist

# The *Initiate* protocol

Global state (virtual): Aggregation of the local states

```
Initiate {  
  role B, S  
  parameter out ID key, out item  
  
  B  $\mapsto$  S: rfq[out ID key, out item]  
}
```

# The *Initiate* protocol

Global state (virtual): Aggregation of the local states

```
Initiate {  
  role B, S  
  parameter out ID key, out item  
  
  B  $\mapsto$  S: rfq [out ID key, out item]  
}
```

# The *Initiate* protocol

Global state (virtual): Aggregation of the local states

Initiate {  
  role B, S  
  parameter out ID key, out item

$B \mapsto S: \text{rfq}[\text{out ID key}, \text{out item}]$   
}

# The *Initiate* protocol

# The *Purchase* Protocol

```
Purchase {  
  role B, S, Shipper  
  parameter out ID key, out item, out price, out outcome  
  private address, resp  
  
  B  $\mapsto$  S: rfq[out ID, out item]  
  S  $\mapsto$  B: quote[in ID, in item, out price]  
  B  $\mapsto$  S: accept[in ID, in item, in price, out address, out resp]  
  B  $\mapsto$  S: reject[in ID, in item, in price, out outcome, out resp]  
  
  S  $\mapsto$  Shipper: ship[in ID, in item, in address]  
  Shipper  $\mapsto$  B: deliver[in ID, in item, in address, out outcome]  
}
```

- ▶ *reject* conflicts with *accept* on resp (a *private* parameter)
- ▶ *reject* or *deliver* must occur for completion (to bind outcome)

# Knowledge and Viability

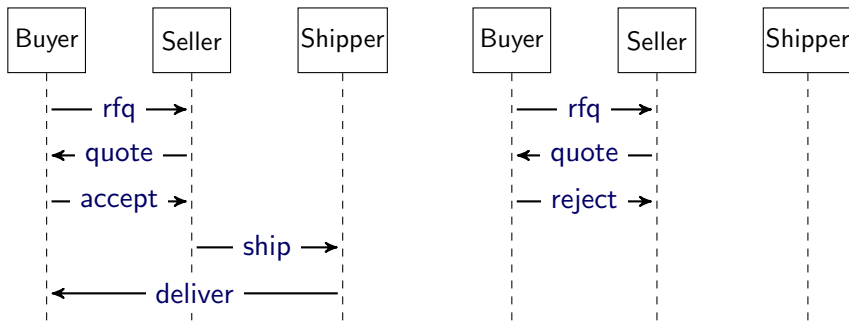

When is a message viable? What effect does it have on a role's local knowledge?

- ▶ Knowledge increases monotonically at each role
- ▶ An  $\lceil \text{out} \rceil$  parameter **creates** and transmits knowledge
- ▶ An  $\lceil \text{in} \rceil$  parameter transmits knowledge
- ▶ Repetitions through multiple paths are harmless and superfluous

# Possible Enactments as Sets of Local Histories

Each participant's local history: set of messages sent and received

# Polymorphism

Same message schema, but different adornments

```
Flexible-Offer {  
  role B, S  
  parameter in ID key, out item, out price, out qID  
  
  B  $\mapsto$  S: rfq[in ID, out item, nil price]  
  B  $\mapsto$  S: rfq[in ID, out item, out price]  
  
  S  $\mapsto$  B: quote[in ID, in item, out price, out qID]  
  S  $\mapsto$  B: quote[in ID, in item, in price, out qID]  
}
```

- ▶ B has priority on generating price, but if it chooses not to (by sending *rfq* without price), then S can generate it

# Remark on Control versus Information Flow

- ▶ Control flow
  - ▶ Natural within a single computational thread
  - ▶ Exemplified by conditional branching
  - ▶ Presumes master-slave relationship across threads
  - ▶ Impossible between mutually autonomous parties because neither controls the other
  - ▶ May sound appropriate, but only because of long habit
- ▶ Information flow
  - ▶ Natural across computational threads
  - ▶ Explicitly tied to causality

# Information Centrism

Characterize each interaction purely in terms of information

- ▶ Explicit causality
  - ▶ Flow of information coincides with flow of causality
  - ▶ No hidden coordination
- ▶ Keys
  - ▶ Uniqueness
  - ▶ Basis for completion
- ▶ Integrity
  - ▶ Parameter has at most one value in any enactment
- ▶ Immutability
  - ▶ Durability
  - ▶ Robustness: insensitivity to
    - ▶ Reordering by infrastructure
    - ▶ Retransmission: one delivery is all it needs
